

SoundPLUS™ Stereo Audio DIGITAL-TO-ANALOG CONVERTER with VCXO and PLL

FEATURES

- COMPLETE DELTA-SIGMA STEREO DAC
- VOLTAGE-CONTROLLED CRYSTAL OSCILLATOR:
27MHz ± 150 ppm Output with 0V to 3V Input
- PROGRAMMABLE PLL
256f_s or 384f_s Audio System Clock Output
- DYNAMIC PERFORMANCE:
Dynamic Range: 94dB
SNR: 94dB
THD+N: -89dB
- SAMPLING FREQUENCIES:
16kHz, 22.05kHz, 24kHz
32kHz, 44.1kHz, 48kHz
64kHz, 88.2kHz, 96kHz
- SERIAL AUDIO INTERFACE:
Standard or I²S™ Data Formats
16-, 20-, or 24-Bit Data
- I²C-BUS™ INTERFACE FOR CONTROL REGISTERS:
Slave Receiver Operation
7-Bit Addressing
Standard Transfer Rate (up to 100kbps)
- PROGRAMMABLE CONTROLS:
Digital Attenuation (256 steps)
Soft Mute
Infinite Zero Detect Mute
De-Emphasis (32kHz, 44.1kHz, 48kHz)
DAC Output Mode
- SINGLE +5V SUPPLY
- SMALL SSOP-24 PACKAGE

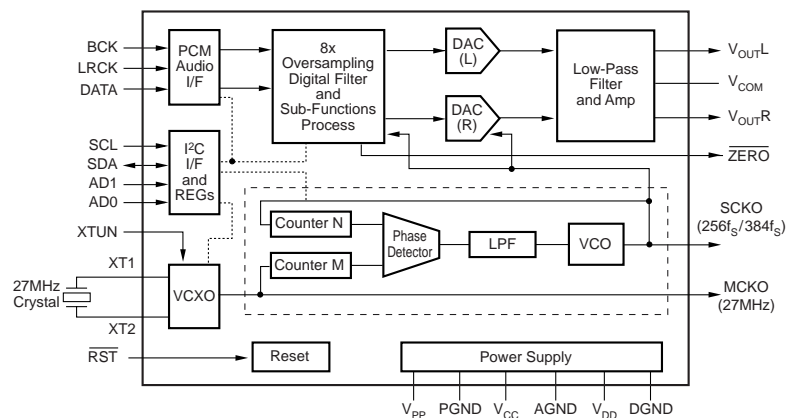

APPLICATIONS

- SET-TOP BOXES
- DIGITAL BROADCAST RECEIVERS

DESCRIPTION

The PCM1740 is a complete stereo audio digital-to-analog converter with on-chip PLL and VCXO. The PCM1740 is designed specifically for set-top box applications requiring high-quality audio playback, a precision tuned 27MHz master clock source, and support for multiple audio-sampling frequencies.

The stereo digital-to-analog converter (DAC) uses multi-bit, delta-sigma architecture, which includes an 8x interpolation filter, 3rd-order noise shaping, 5-level amplitude quantization, and an analog low-pass filter. The PCM1740 includes a number of user-programmable functions, which are accessed via a standard I²C-Bus interface.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SoundPLUS is a trademark of Texas Instruments.
I²C-Bus, I²C, and I²S are trademarks of NXP B.V.
All other trademarks are the property of their respective owners.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Power Supply Voltage ⁽²⁾	+6.5V
Supply Voltage Differences ⁽³⁾	±0.1V
GND Voltage Differences ⁽⁴⁾	±0.1V
Digital Input Voltage	-0.3V to (V _{DD} + 0.3V)
Analog Input Voltage	-0.3V to (V _{CC} + 0.3V)
Input Current (any pins except supplies)	±10mA
Operating Temperature Range	-25°C to +85°C
Storage Temperature	-55°C to +125°C
Junction Temperature	+150°C
Lead Temperature (soldering, 5s)	+260°C
Package Temperature (IR reflow, peak, 10s)	+235°C

NOTES: (1) Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability. (2) V_{CC}, V_{DD}, V_{PP}. (3) Among V_{CC}, V_{DD}, V_{PP}. (4) Among AGND, DGND, and PGND.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

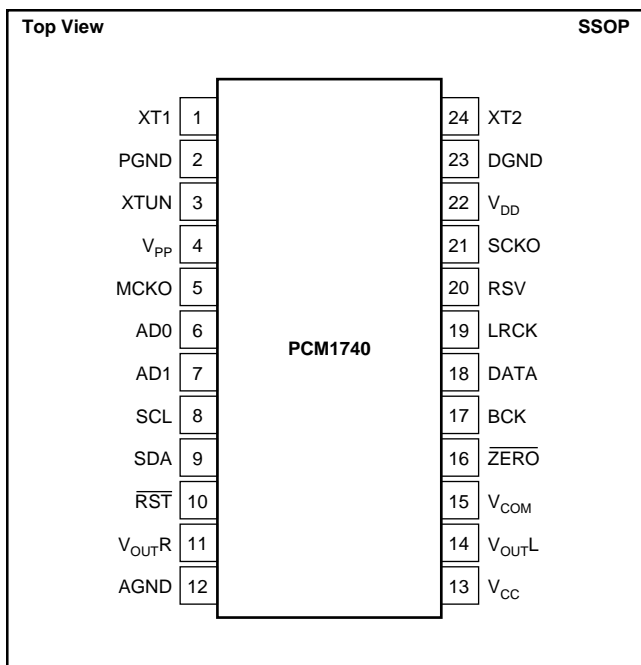

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PIN CONFIGURATION

PIN ASSIGNMENTS

PIN	NAME	I/O	FUNCTION
1	XT1	—	27MHz Crystal connection.
2	PGND	—	PLL and VCXO ground.
3	XTUN	IN	VCXO tune, tuning voltage range from 0V to 3V.
4	V _{PP}	—	PLL and VCXO power supply, +5V.
5	MCKO	OUT	Buffered clock output of VCXO.
6	AD0	IN	Device address pin for I ² C-BUS. ⁽¹⁾
7	AD1	IN	Device address pin for I ² C-BUS. ⁽¹⁾
8	SCL	IN	Bit clock input for I ² C-BUS interface.
9	SDA	IN/OUT	Serial data for I ² C-BUS interface.
10	RST	IN	Reset, active LOW. ⁽²⁾
11	V _{OUTR}	OUT	Right-channel analog voltage output.
12	AGND	—	Analog ground.
13	V _{CC}	—	Analog power supply, +5V.
14	V _{OUTL}	OUT	Left-channel analog voltage output.
15	V _{COM}	—	DC common-mode voltage output.
16	ZERO	OUT	Zero flag output, active LOW. ⁽³⁾
17	BCK	IN	Bit clock input for serial audio data. ⁽¹⁾
18	DATA	IN	Serial audio data input. ⁽¹⁾
19	LRCK	IN	Left and right word clock, equal to the sampling rate (f _s). ⁽¹⁾
20	RSV	—	Reserved must be open.
21	SCKO	OUT	System clock output, 256/384 f _s .
22	V _{DD}	—	Digital power supply, +5V.
23	DGND	—	Digital ground.
24	XT2	—	27MHz Crystal connection.

NOTES: (1) Schmitt trigger input.
 (2) Schmitt trigger input with internal pull-up resistor.
 (3) Open drain output.

ELECTRICAL CHARACTERISTICS

All specifications at $T_A = +25^{\circ}\text{C}$, $V_{CC} = V_{DD} = V_{PP} = 5.0\text{V}$, $f_S = 44.1\text{kHz}$, system clock = $384f_S$, 16-bit data, unless otherwise noted.

- NOTES: (1) Pins 6, 7, 18, 19: AD0, AD1, BCK, DATA, LRCK (Schmitt trigger input).
 (2) Pin 10: RST (Schmitt trigger input with internal pull-up resistor).
 (3) Pins 5, 21: MCKO, SCKO. (4) Pin 16: ZERO (open drain output).
 (5) Pins 8, 9: SCL, SDA.
 (6) Pin 9: SDA (open drain output, $I_{OL} = 3\text{mA}$).
 (7) Pin 9: SDA (from V_{IHMIN} to V_{ILMAX} with a bus capacitance from 10pF to 400pF).
 (8) Pins 8, 9: SCL, SDA (input current each I/O pin with an input voltage between $0.1V_{DD}$ and $0.9V_{DD}$).
 (9) This characteristic is the requirement for crystal oscillator.
 (10) Pin 3: XTUN.
 (11) The maximum response time when the XTUN is changed.
 (12) The maximum delay time from power on to oscillation.
 (13) The maximum lock up time when the PLL frequency is changed.
 (14) The maximum delay time from power on to lock up.
 (15) Dynamic performance specifications are tested with a 20kHz low-pass filter using a Shibasoku distortion analyzer 725 $^\circ\text{C}$ with 30kHz LPF, 400Hz HPF, Average-Mode.
 (16) SNR is tested with infinite zero detection circuit disabled.

TYPICAL CHARACTERISTICS

At $T_A = +25^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{V}$, $f_S = 44.1\text{kHz}$, $f_{\text{SCKO}} = 384f_S = 16.9344\text{MHz}$, and 16-bit data, unless otherwise noted.

TYPICAL CHARACTERISTICS (Cont.)

At $T_A = +25^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{V}$, $f_S = 44.1\text{kHz}$, $F_{SCKO} = 384f_S = 16.9344\text{MHz}$, and 16-bit data, unless otherwise noted.

STEREO DIGITAL-TO-ANALOG CONVERTER

The stereo DACs of the PCM1740 use a multi-level delta-sigma architecture. Based upon a 3rd-order noise shaper and a 5-level amplitude quantizer, this section converts the 8x oversampled, 18-bit input data from the interpolation filter to a 5-level delta-sigma format. A block diagram of the multi-level delta-sigma modulator is shown in Figure 1. This architecture has the advantage of improved stability and increased tolerance to clock jitter when compared to the one-bit (2-level) delta-sigma DACs.

The combined oversampling rate of the delta-sigma modulator and the 8x interpolation filter is $48f_s$ for a $384f_s$ system clock, and $64f_s$ for a $256f_s$ system clock. The theoretical quantization noise performance for the 5-level delta-sigma modulator is shown in Figure 2.

The output of the delta-sigma modulator is low-pass filtered and buffered by an on-chip output amplifier. For best performance, an external low-pass filter is recommended. Refer to the *Applications Information* section of this data sheet for details regarding DAC output filter recommendations.

The PCM1740 includes two analog outputs, V_{OUTL} (pin 14) and V_{OUTR} (pin 11), corresponding to the left and right audio outputs. The full-scale output amplitude is $0.62 \times V_{CC}$, or $3.1V_{PP}$ with a +5V supply and an AC-coupled load of $5k\Omega$ or greater. The analog outputs are centered about the DC common-mode voltage, which is typically $V_{CC}/2$.

The DC common-mode voltage is made available at the V_{COM} output (pin 15). This is an unbuffered output, prima-

FIGURE 2. Quantization Noise Spectrum.

rily used for decoupling purposes. See the *Applications Information* section of this data sheet for more information regarding the use of the V_{COM} output for biasing external circuitry.

VOLTAGE CONTROLLED CRYSTAL OSCILLATOR (VCXO)

The PCM1740 includes an on-chip voltage-controlled crystal oscillator, or VCXO, which is used to generate the 27MHz master clock required by most digital broadcast and MPEG-2 decoding applications.

FIGURE 1. 5-Level $\Delta\Sigma$ Modulator Block Diagram.

The 27MHz clock is available at the MCKO output (pin 5). The VCXO output frequency can be precisely tuned using a control voltage at the XTUN input (pin 3). The tuning range is 27MHz \pm 150ppm typical for a 0V to +3V control voltage range. Figure 3 shows the VCXO equivalent circuit, while Figure 4 shows the typical tuning curve.

At power up, the VCXO requires 5ms start up time. The VCXO also exhibits a 10 μ s settling time in response to changes in the XTUN control voltage. VCXO operation and the MCKO output are not affected by the power on or external reset functions, continuing to operate during the initialization sequence.

Crystal Selection

The VCXO connects to an external 27MHz crystal via XT1 (pin 1) and XT2 (pin 24). The crystal should be AT-cut, fundamental mode with \pm 30ppm accuracy and less than 50 Ω motional resistance. Crystal shunt capacitance should be 3pF maximum, while load capacitance should be less than 7pF. Miniature lead type or surface-mount devices are recommended. External load capacitors are not needed, since they are provided on-chip. The crystal should be placed as close as possible to the XT1 and XT2 pins to reduce effects of parasitic capacitance and land resistance.

PROGRAMMABLE PHASE LOCKED LOOP (PLL)

The PCM1740 includes an on-chip PLL for generating a 256f_s or 384f_s audio system clock from the 27MHz VCXO output. A block diagram of the PLL section is shown in Figure 5. The PLL output clock is used by the digital filter and delta-sigma modulator circuitry, and is made available at the SCKO output (pin 21) for use with additional audio converters and signal processors.

FIGURE 3. VCXO Equivalent Circuit.

FIGURE 4. VCXO Output Frequency (MCKO) versus Tuning Voltage (XTUN).

FIGURE 5. PLL Block Diagram.

The PLL can generate one of nine pre-programmed system clock rates for either $256f_s$ or $384f_s$ output. The PLL output and sampling frequencies are programmed using Control Register 3. Table I shows the available sampling frequencies and the corresponding PLL output clock rates. The reset default condition for the PLL is $f_s = 44.1\text{kHz}$ with $\text{SCKO} = 384f_s$, or 16.9344MHz .

SAMPLING FREQUENCY (LRCK)		INTERNAL SYSTEM Clock - $256f_s$	INTERNAL SYSTEM Clock - $384f_s$
16kHz	Half	4.096MHz	6.144MHz
32kHz	Normal	8.192MHz	12.288MHz
64kHz	Double	16.384MHz	24.576MHz
22.05kHz	Half	5.6448MHz	8.4672MHz
44.1kHz	Normal	11.2896MHz	16.9344MHz
88.2kHz	Double	22.5792MHz	33.8688MHz
24kHz	Half	6.144MHz	9.216MHz
48kHz	Normal	12.288MHz	18.432MHz
96kHz	Double	24.576MHz	36.864MHz

TABLE I. PLL Sampling and System Clock Frequencies.

At power-up, the PLL requires 30ms start up time for stabilization. The PLL also exhibits a settling time of 20ms in response to changes in sampling frequency selection. The PLL output continues to operate during power-on or external reset sequences, with the sampling frequency set to $f_s = 44.1\text{kHz}$ and $\text{SCKO} = 384f_s$.

RESET OPERATION

POWER-ON RESET

The PCM1740 includes power-on reset circuitry for start up initialization. The initialization sequence starts when V_{DD} exceeds 2.2V (typical). The initialization sequence requires 1024 PLL output (or SCKO) clock cycles for completion. During initialization, both V_{OUTL} and V_{OUTR} are forced to $V_{CC}/2$. Figure 6 shows the power-on reset timing, while Table II shows the reset default settings for user-programmable functions. The user should not attempt to write control registers via the I²C-Bus interface during the initialization sequence.

EXTERNAL RESET

The PCM1740 includes an external reset input, $\overline{\text{RST}}$ (pin 10). This input may be used to force an initialization sequence. As shown in Figure 7, the $\overline{\text{RST}}$ pin must be held low for a minimum of 20ns. The initialization sequence will then start on the rising edge of $\overline{\text{RST}}$. Initialization requires 1024 PLL output (or SCKO) clock cycles for completion. During initialization, both V_{OUTL} and V_{OUTR} are forced to $V_{CC}/2$. Table II shows the reset default settings for user-programmable functions. The user should not attempt to write control registers via the I²C-Bus interface during the initialization sequence.

FIGURE 6. Power-On Reset Operation.

FIGURE 7. External Reset Operation.

ZERO FLAG OUTPUT

The PCM1740 includes a zero flag output, $\overline{\text{ZERO}}$ (pin 16). This is an open-drain output, and a 10k Ω pull-up resistor connected to V_{DD} is recommended when using the $\overline{\text{ZERO}}$ flag as a logic output.

The PCM1740 includes an infinite zero detection function that monitors the audio data at the DATA input (pin 18). If the audio data for both the left and right channels is all zeros for 65,536 continuous BCK clock cycles, the zero flag will be activated, turning on a MOSFET switch and connecting the $\overline{\text{ZERO}}$ pin to ground. This provides an active low output that may be used to control an external mute circuit, or as a logic indicator for an audio DSP/decoder or microprocessor.

AUDIO SERIAL INTERFACE

The PCM1740 includes a three-wire serial audio interface. This includes LRCK (pin 19), BCK (pin 17), and DATA (pin 18). The LRCK input is the audio left/right clock, which is used as a latch signal for the interface. The BCK input is used to clock audio data into the serial port. The DATA input carries multiplexed data for the left and right audio channels. Audio data must be Two's Complement, MSB first formatted. Figure 8 shows the typical connection between the PCM1740 audio serial interface and an audio DSP or decoder.

FIGURE 8. Interfacing the PCM1740 to an Audio DSP.

LRCK and BCK Rates

The LRCK input is operated at the sampling frequency, f_s . The BCK input is operated at 32, 48, or 64 times the sampling frequency. Both LRCK and BCK must be synchronous with the SCKO output for proper operation.

Data Formats

The PCM1740 supports two audio interface formats: Standard and I²S. These formats are shown in Figure 9. The audio data word length for the Left and Right channels may be 16-, 20-, or 24-bits. The audio data word length and format are programmed using Control Registers 2 and 3. The reset default condition is Standard format with 16-bit audio data.

Timing Requirements

Figure 10 shows the audio interface timing requirements.

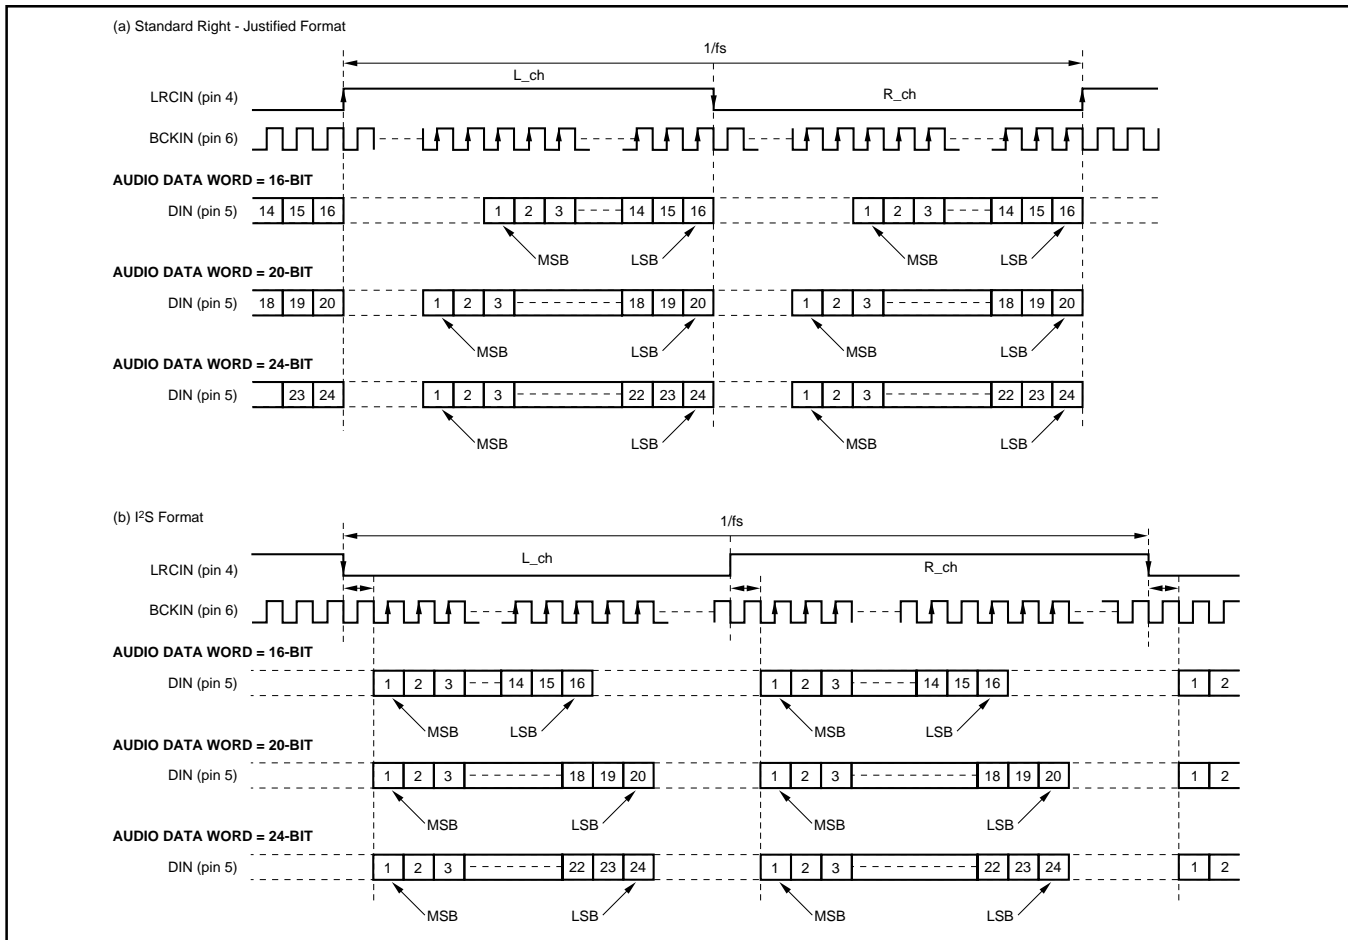

FIGURE 9. Audio Interface Formats.

FIGURE 10. Audio Interface Timing.

Loss of Synchronization

Ideally, LRCK and BCK will be derived from the SCKO output, ensuring synchronous operation. For other cases, the PCM1740 includes circuitry to detect loss of synchronization between the LRCK and the system clock, SCKO. A loss of synchronization condition is detected when the phase relationship between SCKO and LRCK exceeds ± 6 BCK cycles during one sample period, or $1/f_S$. If a loss of synchronization condition is detected, the DAC operation will halt within one sample period and the analog outputs will be forced to $V_{CC}/2$ until re-synchronization between LRCK and SCKO is completed. Figure 11 shows the state of the analog outputs given a loss of synchronization event. During the undefined states, as well as transitions between normal and undefined states, the analog outputs may generate audible noise.

USER PROGRAMMABLE FUNCTIONS

The PCM1740 includes a number of programmable functions, which are configured using five control registers. These registers are accessed using the I²C-Bus interface.

FIGURE 11. Loss of Synchronization and Analog Output State.

This section describes the control registers, while the I²C-Bus interface is described in a later section. Table II lists the available functions and their corresponding reset default condition.

Register Map

The control register map is shown in Table III. Sub-address bits B8 through B10 are used to specify the register that is being written. All reserved bits, shown as “res”, must be set to ‘0’.

Register Descriptions

The following pages provide detailed descriptions of the five control registers and their associated functions. All reserved bits, shown as “res”, must be set to ‘0’.

FUNCTION	MODE BY DEFAULT
Audio Data Format Select: Standard Format/I ² S Format	Standard Format
Audio Data Word Select: 16-Bit/20-Bit/24-Bit	16-Bit
Polarity of LR-clock Selection	Left/Right = HIGH/LOW
De-emphasis Control: OFF, 32kHz, 44.1kHz, 48kHz	OFF
Soft Mute Control	OFF
Attenuation Data for Left-channel	0dB
Attenuation Data for Right-channel	0dB
Attenuation Data Mode Control	Left-channel, Right-channel Individually
Analog Output Mode Select	Stereo Mode
Infinity Zero Detect Mute Control	OFF
DACs Operation Control	ON
System Clock Select: 256f _S /384f _S	384f _S
Sampling Frequency Select: 32kHz Group, 44.1kHz Group, 48kHz Group	44.1kHz Group
Sampling Frequency Multiplier: Normal/Double/Half	Normal, x1

Register 0	res	res	res	res	res	0	0	0	AL7	AL6	AL5	AL4	AL3	AL2	AL1	AL0

Left Channel Attenuation Data

Default: AL[7:0] = FF_{HEX}

Register 0 is used to set the digital attenuation level for the Left Channel. If the ATC bit in Register 3 is set to '1', then these data are also used to control the Right Channel attenuation. The attenuation level is defined by the following relationships:

Attenuation (dB) = 20 x log (AL[7:0]_{DEC} ÷ 256), when AL[7:0] = 01_{HEX} (1_{DEC}) through FE_{HEX} (254_{DEC})

Attenuation (dB) = -∞ (or Mute), when AL[7:0] = 00_{HEX}

Attenuation (dB) = 0dB, when AL[7:0] = FF_{HEX}

The Attenuation Load bit, LD, in Register 4 must be set to '1' in order to update attenuation settings.

If LD is set to '0', the attenuation remains at the previously programmed level, ignoring the new data until LD is set to '1'.

	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Register 1	res	res	res	res	res	0	0	1	AR7	AR6	AR5	AR4	AR3	AR2	AR1	AR0

Right Channel Attenuation Data

Default: AR[7:0] = FF_{HEX}

Register 1 is used to set the digital attenuation level for the Right Channel. If the ATC bit in Register 3 is set to '1', then the Left Channel attenuation data in Register 1 are used to control the Right Channel attenuation. The attenuation level is defined by the following relationships:

Attenuation (dB) = 20 x log (AR[7:0]_{DEC} ÷ 256), when AR[7:0] = 01_{HEX} (1_{DEC}) through FE_{HEX} (254_{DEC})

Attenuation (dB) = -∞ (or Mute), when AR[7:0] = 00_{HEX}

Attenuation (dB) = 0dB, when AR[7:0] = FF_{HEX}

The Attenuation Load bit, LD, in Register 4 must be set to '1' in order to update attenuation settings.

If LD is set to '0', the attenuation remains at the previously programmed level, ignoring the new data until LD is set to '1'.

	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Register 2	res	res	res	res	res	0	1	0	PL3	PL2	PL1	PL0	IW1	IW0	DEM	MUT

MUT Soft Mute Control

The MUT bit controls the soft mute function. Soft mute changes the digital attenuation level for both the Left and Right channels, stepping from the currently programmed value to infinite attenuation one step per sample period, or 1/f_s. This provides a quiet muting of the outputs without audible noise.

MUT = 0	Soft Mute Disabled (default)
MUT = 1	Soft Mute Enabled

DEM Digital De-Emphasis

The DEM bit controls the digital de-emphasis function, which is valid only for 32kHz, 44.1kHz, and 48kHz sampling frequencies. The de-emphasis plots are shown in the *Typical Characteristics* section of this data sheet.

DEM = 0	De-Emphasis OFF (default)
DEM = 1	De-Emphasis ON

IW0 **Audio Data Word Length**
IW1

The IW0 and IW1 bits are used to select the data word length for the audio serial interface. The audio data format is selected using the IIS bit in Register 3.

IW1	IW0	Word Length
0	0	16-bits (default)
0	1	20-bits
1	0	24-bits
1	1	Reserved

PL[3:0] **Analog Output Mode Select**

Bits PL[3:0] are used to set the output mode for the analog outputs. Refer to the table below.

PL3	PL2	PL1	PL0	V _{OUTL}	V _{OUTR}	Notes
0	0	0	0	Mute	Mute	Mute
0	0	0	1	Left	Mute	
0	0	1	0	Right	Mute	
0	0	1	1	(L+R)/2	Mute	
0	1	0	0	Mute	Left	
0	1	0	1	Left	Left	
0	1	1	0	Right	Left	Reverse
0	1	1	1	(L+R)/2	Left	
1	0	0	0	Mute	Right	
1	0	0	1	Left	Right	Stereo (default)
1	0	1	0	Right	Right	
1	0	1	1	(L+R)/2	Right	
1	1	0	0	Mute	(L+R)/2	
1	1	0	1	Left	(L+R)/2	
1	1	1	0	Right	(L+R)/2	
1	1	1	1	(L+R)/2	(L+R)/2	Mono

Register 3	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
	res	res	res	res	res	0	1	1	SF1	SF0	DSR1	DSR0	SYS	ATC	LRP	IIS

IIS **Audio Data Format**

The IIS bit is used to select the audio data format, either Standard Right-Justified or I²S.

IIS = 0	Standard Right Justified (default)
IIS = 1	I ² S

LRP **LRCK Polarity**

The LRP bit selects the polarity of left/right clock input (LRCK) when using the Standard Right-Justified audio data format. This bit has no effect when using the I²S audio data format.

LRP = 0	Left Channel when LRCK = High; Right Channel when LRCK = Low (default)
LRP = 1	Left Channel when LRCK = Low; Right Channel when LRCK = High

ATC **Attenuation Mode Control**

The ATC bit is used to select independent or common attenuation data for the Left and Right channels.

ATC = 0	Independent: Left Channel uses Register 0 and Right Channel uses Register 1 (default)
ATC = 1	Common: Left and Right Channels both use Register 0

SYS Audio System Clock (or SCKO)

The SYS bit is used to select the system clock (or SCKO) frequency, either $256f_s$ or $384f_s$.

SYS = 0	$384f_s$ (default)
SYS = 1	$256f_s$

DSR0 DSR1 Sampling Frequency Multiplier

The DSR0 and DSR1 bits are used to select the multiplier used in conjunction with the SF0 and SF1 bits.

DSR1	DSR0	Multiplier
0	0	Normal, x1 (default)
0	1	Double, x2
1	0	Half, x 1/2
1	1	Reserved

SF0 SF1 Sampling Frequency Select

The SF0 and SF1 bits are used to select the sampling frequency group (32kHz, 44.1kHz, or 48kHz). Frequency selection must be made with an interval time greater than $20\mu s$. The DSR0 and DSR1 bits, described previously, are used to select the multiplier.

SF1	SF0	Sampling Frequency Group
0	0	44.1kHz Group (22.05kHz, 44.1kHz, or 88.2kHz) (default)
0	1	48 kHz Group (24kHz, 48kHz, or 96kHz)
1	0	32 kHz Group (16kHz, 32kHz, or 64kHz)
1	1	Reserved

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
res	res	res	res	res	1	0	0	res	res	res	res	res	OPE	IZD	LD

LD Attenuation Data Load Control

The LD bit is used to simultaneously set the Left and Right digital attenuation data. When LD is set to '1', the digital attenuation data given by Registers 0 and 1 are loaded for the Left and Right channels. When LD is set to '0', updates to Registers 0 and 1 are ignored, and the attenuation settings remain as previously programmed until LD is set to '1'.

LD = 0	Disabled
LD = 1	Enabled: Left and Right Attenuation Data Updated Simultaneously

IZD Infinite Zero Detect Mute

The IZD bit is used to enable/disable the infinite zero detect mute function. The PCM1740 includes infinite zero detection logic that monitors the audio data at the DATA input (pin 18). If the audio data for both the Left and Right channels are all zeros for 65,536 continuous BCK clock cycles, the zero flag will be activated and output amplifier will be disconnected from the output of the delta-sigma modulator. The output amplifier input is switched to the DC common-mode voltage. This forces V_{OUTL} and V_{OUTR} to $V_{CC}/2$. The \overline{ZERO} output flag (pin 16) is not affected by the setting of this bit.

IZD = 0	Disabled (default)
IZD = 1	Enabled

OPE DAC Operation Control

The OPE bit is used to enable/disable the operation of the DACs. When enabled, the DAC outputs are connected to the output amplifier for normal operation. When disabled, the output amplifier is disconnected from the DAC output and switched to the DC common-mode voltage. This forces V_{OUTL} and V_{OUTR} to $V_{CC}/2$.

OPE = 0	Enabled: Normal Operation(default)
OPE = 1	Disabled: Outputs forced to $V_{CC}/2$

I²C-BUS INTERFACE DESCRIPTION

The PCM1740 includes an I²C-Bus interface for writing the internal control registers. This provides an industry standard method for interfacing a host CPU control port to the PCM1740. The PCM1740 operates as a Slave receiver on the bus, and supports data transfer rates up to 100 kilobits-per-second (kbps).

The I²C-Bus interface is comprised of four signals: SDA (pin 9), SCL (pin 8), AD0 (pin 6), and AD1 (pin 7). The SCL input is the serial data clock, while SDA is the serial data input. SDA carries start/stop, slave address, sub-address (or register address), register, and acknowledgment data. The AD0 and AD1 inputs form the lower two bits of the slave address.

Slave Address

The PCM1740 Slave address consists of seven bits, as shown in Figure 12. The five most significant bits are fixed, while the two least significant bits, named A0 and A1, are defined by the logic levels present at the AD0 and AD1 input pins. This allows four PCM1740s to reside on the same I²C-Bus.

Bus Operation

Figure 13 shows the typical configuration of the PCM1740 on the I²C-Bus. The Master transmitter or transmitter/receiver is typically a microcontroller, or an audio DSP/decoder. The Master device controls the data transfers on the bus. The PCM1740 operates as a Slave receiver, and accepts data from the Master when it is properly addressed. The data transfer may be comprised of an unlimited number of bytes, or 8-bit data words. Figure 14 shows the message transfer protocol.

For normal bit transfer on the bus, data on SDA must be static while SCL is High. Data on SDA may change High/Low states when SCL is Low. The exception to this rule is the Start and Stop conditions.

The Start condition is defined by a High-to-Low transition on SDA while SCL is High, and is denoted with an 'S' in Figure 12. The Stop condition is defined by a Low-to-High transition on SDA while SCL is High, and is denoted with a 'P' in Figure 12. The Start and Stop conditions are always generated by the Master. All data transfers from Master to Slave begin with a Start condition and end with a Stop condition. The bus is considered to be busy after the Start condition, and becomes free some time after the Stop condition.

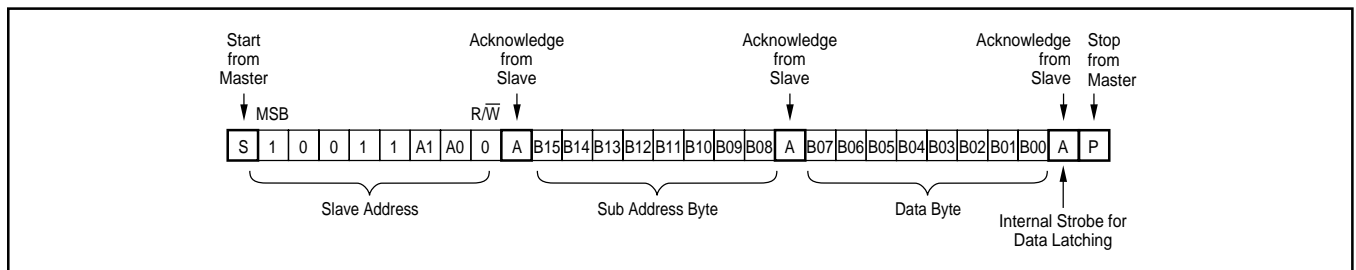

FIGURE 12. Control Data Format.

FIGURE 13. Typical I²C-Bus Configuration.

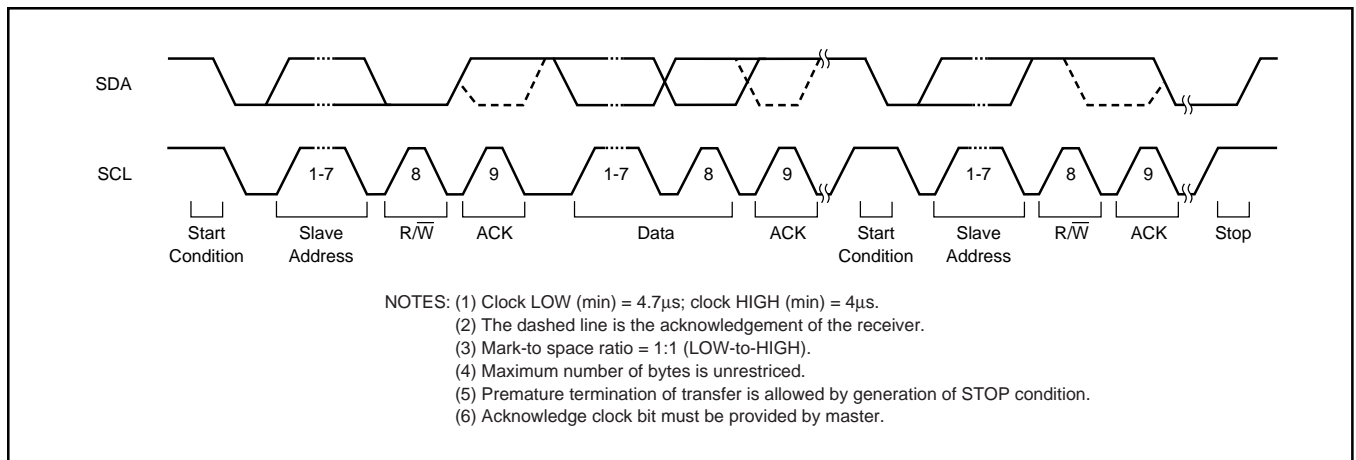

FIGURE 14. I²C Bus Data Transfer.

Data transfer begins with a Start condition, and is immediately followed by the Slave address and Read/Write bit. The Read/Write bit is set to '0' for the PCM1740, in order to write data to the control register specified by the sub-address. This is followed by an acknowledgment from the PCM1740, the sub-address (that is, the control register address), another acknowledgment from the PCM1740, the control register data, and another acknowledgment from the PCM1740. What happens after this depends on if the user wants to continue writing additional control registers, or if they want to terminate the data transfer. If the user wants to continue, the acknowledgment is followed by a Start condi-

tion for the next write sequence. If the user decides to terminate the data transfer, then a Stop condition is generated by the Master.

The I²C-Bus specification defines timing requirements for devices connected to the bus. Timing requirements for the PCM1740 are shown in Figure 15.

Reference

For additional information regarding the I²C-Bus, please refer to the I²C-Bus Specification available online from NXP Semiconductors.

FIGURE 15. I²C Bus Timing.

APPLICATIONS INFORMATION

BASIC CONNECTION DIAGRAM

A basic connection diagram is shown in Figure 16. Power supply and reference decoupling capacitors should be located as close as possible to the PCM1740 package. The 27MHz crystal should also be located as close as possible to the package, to reduce the effects of parasitic capacitance on VCXO operation.

A single +5V supply is recommended, to avoid issues with power-supply sequencing and SCR latch-up. It is recommended that this supply be separate from the system digital power supply. In cases where this is not practical, an

inductor or ferrite bead should be placed in series with the +5V supply connection to reduce or eliminate high-frequency noise on the supply line.

In cases where overshoot or ringing is present on the LRCK or BCK signals, a series resistance of 25Ω to 100Ω should be added. The resistor forms a simple RC filter with the device input and printed circuit board (PCB) parasitic capacitance, dampening the overshoot and ringing effects, while reducing high-frequency noise emissions.

TYPICAL APPLICATION DIAGRAM

Figure 17 shows the PCM1740 being used as part of the audio sub-system in a set-top box application.

FIGURE 16. Basic Connection Diagram.

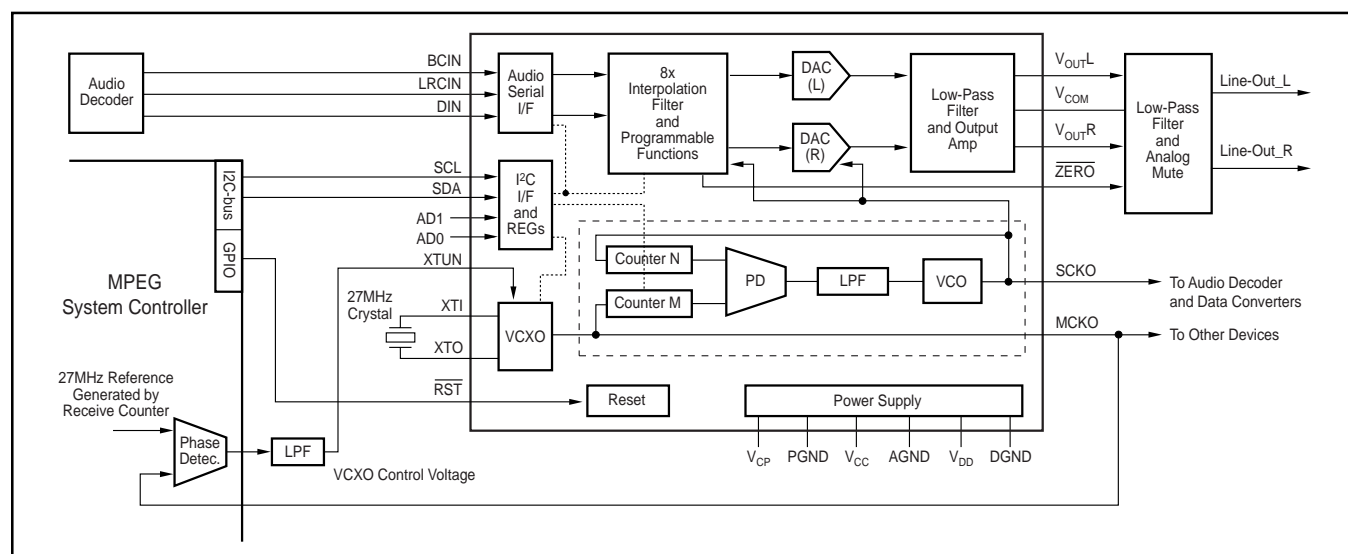

FIGURE 17. Typical Application Diagram.

The VTUN control voltage is generated by the MPEG-2 controller, which compares the MCKO output clock from the PCM1740 with the clock count received from the transmitter. VTUN is adjusted to retain clock synchronization between the transmitted and received signals. The SCKO output is used as the audio master clock for the audio decoder and additional data converters.

V_{COM} Output

The unbuffered DC common-mode voltage output, V_{COM} (pin 15), is brought out mainly for de-coupling purposes. V_{COM} is nominally biased to V_{CC}/2. The V_{COM} output may be used to bias external circuits, but it must be connected to a high-impedance node or buffered using a voltage follower. Figure 18 shows examples of the proper use of the V_{COM} output for external biasing applications.

DAC OUTPUT FILTERING

Delta-Sigma DACs utilize noise shaping techniques to improve in-band signal-to-noise (SNR) performance at the expense of generating increased out of band noise above the Nyquist frequency, or f_s/2. The out-of-band noise must be low-pass filtered in order to provide optimal converter performance. This is accomplished by a combination of on-chip and external low-pass filtering.

The PCM1740 includes an on-chip low-pass filter as part of the output amplifier stage. The frequency response for the filter is shown in the *Typical Characteristics* section of this data sheet. The -3dB cutoff frequency is fixed at 100kHz.

Figure 19 shows the recommended external low-pass active filter circuits for dual and single-supply applications. These circuits are second-order Butterworth filters using the Multiple Feedback (MFB) circuit arrangement. Both filters have a cutoff frequency of 30kHz. Figure 19(a) is a dual-supply filter with a gain of 1.85 (for a standard 2 V_{RMS} line output level). Figure 19(b) is a single-supply filter with a gain of 1. Values for the filter components may be calculated using the FilterPro program, available from the TI web site (www.ti.com) and local sales offices. For more information regarding MFB active filter design and the FilterPro program, refer to TI Application Report SBFA001.

Since the overall system performance is defined primarily by the quality of the DACs and their associated analog output circuitry, op amps designed specifically for audio applications are recommended for the active filters. TI's OPA2134, OPA2353, and OPA2343 dual op amps are ideal for use with the PCM1740.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

Carrier tape design is defined largely by the component length, width, and thickness.

A_o = Dimension designed to accommodate the component width.
B_o = Dimension designed to accommodate the component length.
K_o = Dimension designed to accommodate the component thickness.
W = Overall width of the carrier tape.
P = Pitch between successive cavity centers.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
